Recommended Improvements

Guidance for every issue detected in this crawl, in the same order as the summary table above.

Duplicated Titles (23 pages)

UNDERSTANDING THE ISSUE

Duplicate titles make it difficult for search engines to distinguish between pages. This can lead to keyword cannibalization where your own pages compete against each other in search results.

HOW TO IMPROVE

Ensure every page has a unique title. Review duplicated titles and differentiate them by adding specific details about the page content, location, or audience.

https://developers.google.com/search/docs/advanced/crawling/duplicate-titles

Blocked by Robots.txt (6 pages)

UNDERSTANDING THE ISSUE

These pages are disallowed in the robots.txt file. This prevents search engines from crawling them, meaning they won't be indexed or ranked.

HOW TO IMPROVE

Review your robots.txt file. Remove the Disallow rule for these URLs if you want them to be indexed. If they are intentionally blocked, ensure they are not being linked to internally.

https://developers.google.com/search/docs/crawling-indexing/robots/intro

4XX Client Error (5 pages)

UNDERSTANDING THE ISSUE

4XX errors indicate client-side issues where the requested page cannot be reached (e.g., 404 Not Found, 403 Forbidden). These result in a poor user experience and wasted crawl budget.

HOW TO IMPROVE

For 404s, redirect to a relevant page or fix the broken link. For 403s, check permissions. For other 4xx errors, investigate the specific cause (e.g., bad request structure) and resolve it.

https://developers.google.com/search/docs/crawling-indexing/http-network-errors

Canonical Points to a Redirect (4 pages)

UNDERSTANDING THE ISSUE

The canonical target responds with a redirect rather than a 200. Search engines have to follow an extra hop and may distrust the signal, slowing consolidation of ranking signals.

HOW TO IMPROVE

Update the canonical to point straight at the final destination URL that returns 200.

https://ahrefs.com/blog/canonical-tags/

Redirect Detected (90 pages)

UNDERSTANDING THE ISSUE

Redirects add an extra HTTP round-trip which increases page load time. Even a single redirect can meaningfully impact Core Web Vitals, especially on mobile networks with high latency.

HOW TO IMPROVE

Replace the redirect with a direct link to the final destination URL, or consolidate to a single 301 redirect if removal is not possible.

https://developers.google.com/search/docs/crawling-indexing/redirects

Low Readability Score (80 pages)

UNDERSTANDING THE ISSUE

The Flesch Reading Ease score measures how easy your text is to understand. Scores below 50 indicate 'difficult' or 'very difficult' content, which can hurt user engagement and accessibility.

HOW TO IMPROVE

Simplify sentence structure, use shorter words, and break up complex paragraphs. Aim for a Flesch score of 60-70 (plain English) for general audiences.

https://yoast.com/flesch-reading-ease-score/

Page Title > 60 Chars (42 pages)

UNDERSTANDING THE ISSUE

Search engines usually truncate titles that exceed 60 characters (or ~600 pixels). Truncated titles can look unprofessional and hide important keywords from users.

HOW TO IMPROVE

Rewrite titles to be concise and keep them under 60 characters. Place the most important keywords at the beginning of the title.

https://moz.com/learn/seo/title-tag

Duplicated Descriptions (34 pages)

UNDERSTANDING THE ISSUE

Duplicate meta descriptions provide no unique value and can lead to lower CTR across all affected pages as they won't stand out to users.

HOW TO IMPROVE

Audit your duplicated descriptions and rewrite them to reflect the unique value proposition of each specific page.

https://moz.com/learn/seo/meta-description

Descriptions > 160 Chars (19 pages)

UNDERSTANDING THE ISSUE

Meta descriptions over 160 characters are usually truncated in SERPs. Important information or calls-to-action at the end may be lost.

HOW TO IMPROVE

Shorten descriptions to stay within 155-160 characters. Moving the most important information to the front is recommended.

https://ahrefs.com/blog/meta-description-seo/

Canonical Points to Another Page (5 pages)

UNDERSTANDING THE ISSUE

The canonical tag points to a URL different from the one crawled. This is correct for genuine duplicates (print views, parameterised URLs), but on a page that should rank on its own it tells search engines to index a different URL instead.

HOW TO IMPROVE

Confirm each of these pages really is a duplicate of its canonical target. If the page should be indexed in its own right, change the canonical to be self-referencing.

https://ahrefs.com/blog/canonical-tags/

NoIndex Pages (2 pages)

UNDERSTANDING THE ISSUE

The 'noindex' directive tells search engines not to show the page in search results. If important pages are marked as noindex, they will not get any organic traffic.

HOW TO IMPROVE

Check your meta robots tags or X-Robots headers. Remove the 'noindex' directive from pages that you want to be discovered and indexed by search engines.

https://developers.google.com/search/docs/crawling-indexing/block-indexing

NoFollow Pages (2 pages)

UNDERSTANDING THE ISSUE

The 'nofollow' directive tells search engines not to follow the links on a page. This can prevent search engines from discovering other pages on your site.

HOW TO IMPROVE

Review your meta robots tags. Change 'nofollow' to 'follow' unless you have a specific reason to prevent robots from following links on that page.

https://developers.google.com/search/docs/crawling-indexing/qualify-outbound-links

Inline CSS Detected (100 pages)

UNDERSTANDING THE ISSUE

Inline CSS prevents browser caching and increases page size. It also makes maintenance harder and can block rendering if not managed carefully.

HOW TO IMPROVE

Move inline CSS styles to dedicated external stylesheet files. Use CSS classes instead of inline style attributes to enable caching and improve maintainability.

https://web.dev/defer-non-critical-css/

Cookies Detected (100 pages)

UNDERSTANDING THE ISSUE

Websites that set cookies without user consent can violate GDPR and ePrivacy regulations. Unnecessary cookies also increase privacy concerns and can slow down page loads.

HOW TO IMPROVE

Implement a cookie consent banner that lets users opt in before non-essential cookies are set. Audit your cookies and remove any that are not strictly necessary.

https://gdpr.eu/cookies/

Thin Content (<300 words) (22 pages)

UNDERSTANDING THE ISSUE

Thin content refers to pages with very little text. Search engines may perceive these pages as 'low value' and avoid ranking them highly.

HOW TO IMPROVE

Increase the depth of your content by adding more helpful information, analysis, or multimedia. If a page doesn't need more content, consider combining it with another page.

https://developers.google.com/search/docs/essentials/creating-helpful-content

Large HTML Page (>100KB) (8 pages)

UNDERSTANDING THE ISSUE

HTML documents larger than 100KB take longer to download and parse, especially on mobile devices. Heavy HTML often indicates excessive inline CSS/JS or bloated DOM structure.

HOW TO IMPROVE

Externalize CSS and JavaScript files. Minify your HTML and review your page structure to remove unnecessary nesting or excessive hidden elements.

https://web.dev/reduce-network-payloads-and-compress-assets/

Images Missing Alt Text (2 pages)

UNDERSTANDING THE ISSUE

The alt attribute is the text a screen reader announces in place of an image and what a browser shows when the image fails to load. It is also the main signal Google Images uses to understand a picture. An <img> with no alt attribute at all is an accessibility failure (WCAG 1.1.1); one with alt="" is valid only when the image is purely decorative.

HOW TO IMPROVE

For every meaningful image, add an alt attribute that describes what the image conveys in context, e.g. <img src="/team/ana.jpg" alt="Ana Ruiz, Head of SEO, speaking at a conference">. Keep it concise (roughly under 125 characters), don't start with "image of" or "picture of", and don't keyword-stuff. For decorative images (spacers, background flourishes, icons next to text that already says the same thing) use an explicit empty alt="" so assistive tech skips them. In a CMS, fill the "alt text" / "alternative text" field on each media item; in templates, make the alt a required field of the image component so new content can't ship without it. For CSS background images that carry meaning, move them into <img> so they can have alt text.

https://developers.google.com/search/docs/appearance/google-images#descriptive-alt-text
