Recommended Improvements

Guidance for every issue detected in this crawl, in the same order as the summary table above.

Duplicated Titles (72 pages)

UNDERSTANDING THE ISSUE

Duplicate titles make it difficult for search engines to distinguish between pages. This can lead to keyword cannibalization where your own pages compete against each other in search results.

HOW TO IMPROVE

Ensure every page has a unique title. Review duplicated titles and differentiate them by adding specific details about the page content, location, or audience.

https://developers.google.com/search/docs/advanced/crawling/duplicate-titles

Canonical Points to a Noindex Page (46 pages)

UNDERSTANDING THE ISSUE

The canonical target is marked noindex. Combining canonical and noindex sends contradictory instructions — consolidate here, but don't index the winner — and search engines may apply the noindex to this page too.

HOW TO IMPROVE

Point the canonical at an indexable URL, or remove the noindex from the target if it is the intended master copy. Never pair rel="canonical" with noindex on the same cluster.

https://developers.google.com/search/docs/crawling-indexing/consolidate-duplicate-urls#dont-us…

H1 Missing (35 pages)

UNDERSTANDING THE ISSUE

The H1 tag is the primary heading and should tell both users and search engines what the page is about. Missing it creates a poor content hierarchy.

HOW TO IMPROVE

Identify the main topic of your page and add a single <h1> tag at the top of the content structure.

https://moz.com/learn/seo/headings

4XX Client Error (6 pages)

UNDERSTANDING THE ISSUE

4XX errors indicate client-side issues where the requested page cannot be reached (e.g., 404 Not Found, 403 Forbidden). These result in a poor user experience and wasted crawl budget.

HOW TO IMPROVE

For 404s, redirect to a relevant page or fix the broken link. For 403s, check permissions. For other 4xx errors, investigate the specific cause (e.g., bad request structure) and resolve it.

https://developers.google.com/search/docs/crawling-indexing/http-network-errors

Canonical Points to a Redirect (4 pages)

UNDERSTANDING THE ISSUE

The canonical target responds with a redirect rather than a 200. Search engines have to follow an extra hop and may distrust the signal, slowing consolidation of ranking signals.

HOW TO IMPROVE

Update the canonical to point straight at the final destination URL that returns 200.

https://ahrefs.com/blog/canonical-tags/

Blocked by Robots.txt (3 pages)

UNDERSTANDING THE ISSUE

These pages are disallowed in the robots.txt file. This prevents search engines from crawling them, meaning they won't be indexed or ranked.

HOW TO IMPROVE

Review your robots.txt file. Remove the Disallow rule for these URLs if you want them to be indexed. If they are intentionally blocked, ensure they are not being linked to internally.

https://developers.google.com/search/docs/crawling-indexing/robots/intro

Unsafe Cross-Origin Links (151 pages)

UNDERSTANDING THE ISSUE

Links with target="_blank" without rel="noopener noreferrer" pose a security risk. The opened page can access your page's window object via window.opener and redirect it to a malicious site.

HOW TO IMPROVE

Add rel="noopener noreferrer" to every link that uses target="_blank". This is a security best practice and prevents tab-napping attacks.

https://web.dev/external-anchors-use-rel-noopener/

Low Readability Score (96 pages)

UNDERSTANDING THE ISSUE

The Flesch Reading Ease score measures how easy your text is to understand. Scores below 50 indicate 'difficult' or 'very difficult' content, which can hurt user engagement and accessibility.

HOW TO IMPROVE

Simplify sentence structure, use shorter words, and break up complex paragraphs. Aim for a Flesch score of 60-70 (plain English) for general audiences.

https://yoast.com/flesch-reading-ease-score/

Redirect Detected (93 pages)

UNDERSTANDING THE ISSUE

Redirects add an extra HTTP round-trip which increases page load time. Even a single redirect can meaningfully impact Core Web Vitals, especially on mobile networks with high latency.

HOW TO IMPROVE

Replace the redirect with a direct link to the final destination URL, or consolidate to a single 301 redirect if removal is not possible.

https://developers.google.com/search/docs/crawling-indexing/redirects

Duplicated Descriptions (82 pages)

UNDERSTANDING THE ISSUE

Duplicate meta descriptions provide no unique value and can lead to lower CTR across all affected pages as they won't stand out to users.

HOW TO IMPROVE

Audit your duplicated descriptions and rewrite them to reflect the unique value proposition of each specific page.

https://moz.com/learn/seo/meta-description

Canonical Points to Another Page (51 pages)

UNDERSTANDING THE ISSUE

The canonical tag points to a URL different from the one crawled. This is correct for genuine duplicates (print views, parameterised URLs), but on a page that should rank on its own it tells search engines to index a different URL instead.

HOW TO IMPROVE

Confirm each of these pages really is a duplicate of its canonical target. If the page should be indexed in its own right, change the canonical to be self-referencing.

https://ahrefs.com/blog/canonical-tags/

NoIndex Pages (49 pages)

UNDERSTANDING THE ISSUE

The 'noindex' directive tells search engines not to show the page in search results. If important pages are marked as noindex, they will not get any organic traffic.

HOW TO IMPROVE

Check your meta robots tags or X-Robots headers. Remove the 'noindex' directive from pages that you want to be discovered and indexed by search engines.

https://developers.google.com/search/docs/crawling-indexing/block-indexing

NoFollow Pages (49 pages)

UNDERSTANDING THE ISSUE

The 'nofollow' directive tells search engines not to follow the links on a page. This can prevent search engines from discovering other pages on your site.

HOW TO IMPROVE

Review your meta robots tags. Change 'nofollow' to 'follow' unless you have a specific reason to prevent robots from following links on that page.

https://developers.google.com/search/docs/crawling-indexing/qualify-outbound-links

Canonical Points to a Non-Indexable Page (46 pages)

UNDERSTANDING THE ISSUE

The canonical target is blocked by robots.txt or otherwise cannot be indexed, so search engines cannot verify it and may ignore the canonical entirely.

HOW TO IMPROVE

Choose a canonical target that is crawlable and indexable. Remove any robots.txt disallow covering the target URL.

https://developers.google.com/search/docs/crawling-indexing/consolidate-duplicate-urls

Page Title > 60 Chars (44 pages)

UNDERSTANDING THE ISSUE

Search engines usually truncate titles that exceed 60 characters (or ~600 pixels). Truncated titles can look unprofessional and hide important keywords from users.

HOW TO IMPROVE

Rewrite titles to be concise and keep them under 60 characters. Place the most important keywords at the beginning of the title.

https://moz.com/learn/seo/title-tag

Descriptions > 160 Chars (19 pages)

UNDERSTANDING THE ISSUE

Meta descriptions over 160 characters are usually truncated in SERPs. Important information or calls-to-action at the end may be lost.

HOW TO IMPROVE

Shorten descriptions to stay within 155-160 characters. Moving the most important information to the front is recommended.

https://ahrefs.com/blog/meta-description-seo/

Inline CSS Detected (151 pages)

UNDERSTANDING THE ISSUE

Inline CSS prevents browser caching and increases page size. It also makes maintenance harder and can block rendering if not managed carefully.

HOW TO IMPROVE

Move inline CSS styles to dedicated external stylesheet files. Use CSS classes instead of inline style attributes to enable caching and improve maintainability.

https://web.dev/defer-non-critical-css/

Cookies Detected (150 pages)

UNDERSTANDING THE ISSUE

Websites that set cookies without user consent can violate GDPR and ePrivacy regulations. Unnecessary cookies also increase privacy concerns and can slow down page loads.

HOW TO IMPROVE

Implement a cookie consent banner that lets users opt in before non-essential cookies are set. Audit your cookies and remove any that are not strictly necessary.

https://gdpr.eu/cookies/

Thin Content (<300 words) (68 pages)

UNDERSTANDING THE ISSUE

Thin content refers to pages with very little text. Search engines may perceive these pages as 'low value' and avoid ranking them highly.

HOW TO IMPROVE

Increase the depth of your content by adding more helpful information, analysis, or multimedia. If a page doesn't need more content, consider combining it with another page.

https://developers.google.com/search/docs/essentials/creating-helpful-content

H2 Missing (37 pages)

UNDERSTANDING THE ISSUE

H2 tags are used for sub-headings to structure the content. Without them, large blocks of text become hard to read for users and difficult to parse for search engines.

HOW TO IMPROVE

Break up your content into sections and use <h2> tags for section headings. This improves readability and allows you to target secondary keywords.

https://ahrefs.com/blog/h1-tag-seo/

URL Has Uppercase Characters (25 pages)

UNDERSTANDING THE ISSUE

URLs with uppercase characters can cause duplicate content issues because some servers treat uppercase and lowercase URLs as different pages. Consistent lowercase URLs are an SEO best practice.

HOW TO IMPROVE

Rewrite URLs using only lowercase characters. Set up 301 redirects from the uppercase versions to the lowercase versions if they are already indexed.

https://moz.com/learn/seo/url

URL Too Long (>100 chars) (21 pages)

UNDERSTANDING THE ISSUE

Long URLs are harder for users to read and share, and search engines may truncate them in results. They also tend to get fewer clicks and can look spammy.

HOW TO IMPROVE

Shorten URLs to under 100 characters with concise, keyword-rich slugs that accurately describe the page content. Remove unnecessary stop words and parameters.

https://developers.google.com/search/docs/fundamentals/seo-starter-guide#url-structure

Large HTML Page (>100KB) (8 pages)

UNDERSTANDING THE ISSUE

HTML documents larger than 100KB take longer to download and parse, especially on mobile devices. Heavy HTML often indicates excessive inline CSS/JS or bloated DOM structure.

HOW TO IMPROVE

Externalize CSS and JavaScript files. Minify your HTML and review your page structure to remove unnecessary nesting or excessive hidden elements.

https://web.dev/reduce-network-payloads-and-compress-assets/

Images Missing Alt Text (2 pages)

UNDERSTANDING THE ISSUE

The alt attribute is the text a screen reader announces in place of an image and what a browser shows when the image fails to load. It is also the main signal Google Images uses to understand a picture. An <img> with no alt attribute at all is an accessibility failure (WCAG 1.1.1); one with alt="" is valid only when the image is purely decorative.

HOW TO IMPROVE

For every meaningful image, add an alt attribute that describes what the image conveys in context, e.g. <img src="/team/ana.jpg" alt="Ana Ruiz, Head of SEO, speaking at a conference">. Keep it concise (roughly under 125 characters), don't start with "image of" or "picture of", and don't keyword-stuff. For decorative images (spacers, background flourishes, icons next to text that already says the same thing) use an explicit empty alt="" so assistive tech skips them. In a CMS, fill the "alt text" / "alternative text" field on each media item; in templates, make the alt a required field of the image component so new content can't ship without it. For CSS background images that carry meaning, move them into <img> so they can have alt text.

https://developers.google.com/search/docs/appearance/google-images#descriptive-alt-text

https://www.w3.org/WAI/tutorials/images/decision-tree/

https://moz.com/learn/seo/alt-text

URL Contains Special Characters (2 pages)

UNDERSTANDING THE ISSUE

Characters like underscores, spaces, and URL-encoded symbols in URLs can cause technical issues. Underscores are not treated as word separators by Google, unlike hyphens.

HOW TO IMPROVE

Replace underscores and spaces in URL slugs with hyphens. Remove or percent-encode other special characters. Ensure all URLs use only alphanumerics and hyphens.

https://developers.google.com/search/docs/crawling-indexing/url-structure
